Reducing carbon dioxide (CO₂) emissions is imperative to stabilizing our future climate. Our ability to reduce these

emissions combined with an understanding of how much fossil-fuel-derived CO₂ the oceans and plants can absorb is central to mitigating climate change. In The Carbon Cycle, leading scientists examine how atmospheric carbon dioxide concentrations have changed in the past

and how this may affect the concentrations in the future. They look at the carbon budget and the "missing sink" for carbon dioxide.

They offer approaches to modeling the carbon cycle, providing mathematical tools for predicting future levels of carbon

Nitrogen is an

essential element for plant growth and development and a key agricultural input-but in excess it can lead to a host of problems for human and ecological health. Across the globe, distribution of fertilizer nitrogen is very uneven, with some areas subject to nitrogen pollution and

others suffering from reduced soil fertility, diminished crop production, and other consequences of inadequate supply. Agriculture and the Nitrogen Cycle provides a global assessment of the role of nitrogen fertilizer in the nitrogen cycle. The focus of the book is
