All About Shear Wall [Design ... - Structural Guide

A shear wall is simply a cantilevered diaphragm to which load is applied at the top of the wall, and is transmitted out along the bottom of the wall. This creates a potential for overturning which must be accounted for, and any over- turning force is typically resisted by hold-downs or tie-downs, at each end of the shear element.

Tables 1 through 3 are for walls with steel studs spaced at no. more than 24 in. on centers. The studs must be doubled at the. shear wall ends. Minimum stud size is 3-1/2 x 1-5/8 x 0.033 in. and minimum track size is 3-1/2 x 1-1/4 x 0.033 in. (minimum. metal base thicknesses).

Shear Walls & Diaphragms When designing a building for lateral loads such as those generated by wind or earthquakes, a design engineer may have several alternatives. Lateral loads may be transferred to the foundation via braced frames or rigid frames, diagonal rods or "X" bracing, including let-in bracing in the ease of wood frame construction, or other methods.
