The war was coming to an end at last. The people of Nagasaki knew this as they desperately tried to survive each day's shortages of food and warmth - ordinary people going about their lives as normally as they could manage. People like Nagai, the doctor who'd just been told he had leukemia; Father Tamaya, the obliging Catholic priest, who'd agreed to postpone a return to his rural parish; and Koichi, the mobilised tram driver, who secretly watched the Noguchi sisters sobbing behind the company toilet block. Because the bombing of Hiroshima had been so devastating and there was severe media censorship, they knew nothing of what had befallen that city except for the unbelievable stories told by a few survivors who had just now arrived. Beyond Japan, forces they could never have imagined were mustering as the Americans prepared to drop their next atomic bomb on the armaments manufacturing city of Kokura. Bad weather, however, sent the pilots and their terrible load to Nagasaki, where a small group of 169 POWs, including 24 Australians, were digging air-raid shelters and repairing bridges near what became the bomb's epicentre. And, above the heads of them all, the machinery of wartime politics stumbled on towards its catastrophic finale. In this compelling narrative - based on eye-witness accounts, contemporary diaries, letters and interviews - Craig Collie collects up the stories of the many levels of devastation suffered on that fateful day. We come as close as history will allow us to being there when 80,000 people died as a result of the bomb, half of that number instantaneously. The world had changed forever and the shock waves would ripple right up to the present day, as we continue to contemplate the terrible power of a nuclear future

This text provides a teachable and readable approach to transport phenomena (momentum, heat, and mass transport) by providing numerous examples and applications, which are particularly important to metallurgical, ceramic, and materials engineers. Because the authors feel that it is important for students and practicing engineers to visualize the physical situations, they have attempted to lead the reader through the development and solution of the relevant differential equations by applying the familiar principles of conservation to numerous situations and by including many worked examples in each chapter. The book is organized in a manner characteristic of other texts in transport phenomena. Section I deals with the properties and mechanics of fluid motion; Section II with thermal properties and heat transfer; and Section III with diffusion and mass transfer. The authors depart from tradition by building on a presumed understanding of the relationships between the structure and properties of matter, particularly in the chapters devoted to the transport properties (viscosity, thermal conductivity, and the diffusion coefficients). In addition, generous portions of the text, numerous examples, and many problems at the ends of the chapters apply transport phenomena to materials processing.

FIRE AND ICE . . . that's what you get when you take the cool looks of the Volkswagon Beetle, Bus, Karmann Ghia, Thing, Squareback or Fastback and unleash the hot performance of the air-cooled VW engine. How to Hot Rod Volkswagen Engines gives the real skinny for breathing-on, blueprinting and bulletproofing your air-cooled Vee-dub. Street, custom, kit car, off road, or full-race, this book gives you all the air-cooled engine-building basics to find and put to the pavement hidden horsepower. Includes tips on carburetion, ignition and exhaust tuning, case beefing, cylinder-head flow work, camshaft selection, lubrication and cooling upgrades, 6-to-12-volt conversions and much more. Plus there's a natty 6-page history of the origins of the first air-cooled VW engines. All neat stuff, this.
